

Security Analysis Report (D8)

Quantum-Inspired Cyber Threat Detection for Teleportation-Based QDS | SIH 2026

1. Executive Security Summary

This report details the statistical security bounds and threat mitigation efficacy of the 3-party teleportation-based Quantum Digital Signature (QDS) architecture secured with ML-KEM-768. All threat evaluation mechanisms are completely deterministic and non-AI based, leveraging exact quantum mechanics, Binomial cumulative distribution bounds, and Wilson score upper confidence bounds.

2. Forgery Probability Bounds (P_{forge} vs L)

3. QBER Separability & Channel Quarantine Confidence

QBER Separability: Honest Channel vs Adversarial Attack
